| Tags .....   | 1  |
| Overview.....  | 2  |
| Language and Framework.....                                | 2  |
| The DTO Payload .....                                      | 2  |
| Request/Response Structure .....                           | 3  |
| Authentication .....                                       | 5  |
| Error Handling .....                                       | 5  |
| Paths .....  | 6  |
| Get Allele Matrices.....                                   | 6  |
| Search Allele Matrix .....                                 | 6  |
| Search Allele Matrix .....                                 | 7  |
| Get Allele Matrix Job status .....                         | 8  |
| List all calls.....  | 8  |
| List all files .....                                       | 9  |
| Get germplasm by study db id.....                          | 9  |
| List all Marker Profiles .....                             | 10 |
| List all Marker Profiles .....                             | 11 |
| Search the studies.....                                    | 11 |
| List all observation variables for given study db id ..... | 12 |
| List all tokens.....                                       | 13 |
| Create a new analyses.....                                 | 13 |
| List all analyses .....                                    | 14 |
| Get an analyses by analysesId .....                        | 15 |
| Update the analyses by analysesId .....                    | 15 |
| authenticate.....  | 16 |
| List all configuration settings.....                       | 17 |
| List all contacts from Contacts search .....               | 17 |
| Create a new contact .....                                 | 18 |
| List all contacts.....                                     | 19 |
| Get a contact by contact id.....                           | 19 |
| Update a contact by contactId.....                         | 20 |
| Get contact by email id .....                              | 20 |
| list .....   | 21 |
| Get a CV group by cvGroupId.....                           | 22 |

|  |    |
|--|----|
| Get a CV group by groupName .....                        | 22 |
| Create a new Controlled Vocabulary.....                  | 23 |
| List all CVs .....                                       | 24 |
| Get a CV by cvId .....                                   | 24 |
| Update a CV by cvId.....                                 | 25 |
| Delete a CV by cvId .....                                | 25 |
| List all CVs in a given groupName .....                  | 26 |
| Create a new dataset .....                               | 27 |
| List all datasets.....                                   | 27 |
| List of types of datasets.....                           | 28 |
| Get datasets by type id .....                            | 29 |
| Get dataset by datasetId .....                           | 29 |
| Update/Replace a dataset by datasetId .....              | 30 |
| List all analyses in a dataset with given datasetId..... | 30 |
| List all jobs for a dataset with datasetId.....          | 31 |
| Create a new display .....                               | 32 |
| List all displays .....                                  | 32 |
| Get a display by displayId .....                         | 33 |
| Update a display with displayId .....                    | 33 |
| List all entities.....                                   | 34 |
| Get entity count for a given entity child.....           | 35 |
| Get count for a given entity.....                        | 35 |
| Get last modified date of an entity.....                 | 36 |
| Create a new experiment.....                             | 37 |
| List all experiments.....                                | 37 |
| Get a experiment by experimentId .....                   | 38 |
| Update an experiment by experimentId .....               | 38 |
| List all protocols for a given experimentId .....        | 39 |
| List of loader files in a given directory.....           | 40 |
| Add a loader file to given directory.....                | 40 |
| Upload a file to given destination .....                 | 41 |
| Detele a file by destination type .....                  | 42 |
| Upload a file for a given job and destination type ..... | 43 |
| Download a job file from a given destination type .....  | 43 |
| Create an extractor instruction file .....               | 44 |
| Get extractor job status by jobName .....                | 45 |
| Download an extractor instructor file .....              | 45 |
| Create loader instruction file .....                     | 46 |
| Get loader job status by job name .....                  | 47 |
| Get a loader instruction file.....                       | 47 |
| Create a new job.....                                    | 48 |

|   |    |
|---|----|
| List all jobs .....                               | 49 |
| Create DNA samples for a given job .....          | 49 |
| Get job details by job name .....                 | 50 |
| Update a job by jobName .....                     | 50 |
| Create a manifest .....                           | 51 |
| List all manifests .....                          | 52 |
| Get manifests by manifestId .....                 | 52 |
| Update a manifest .....                           | 53 |
| List all mapsets .....                            | 54 |
| Create a new Mapset .....                         | 54 |
| List all mapsets .....                            | 55 |
| Get mapsets by mapsetId .....                     | 55 |
| Update a mapset by mapsetId .....                 | 56 |
| List all markers from markers search .....        | 57 |
| Create a new Marker group .....                   | 57 |
| List all markergroups .....                       | 58 |
| Gets all markers in a given markergroup .....     | 58 |
| Update a marker by markergroupId .....            | 59 |
| Create a new marker .....                         | 60 |
| List all markers .....                            | 60 |
| Get a marker by markerId .....                    | 61 |
| Update a marker by markerId .....                 | 62 |
| Create a new NameID .....                         | 62 |
| List all NameIds .....                            | 63 |
| Create a new organization .....                   | 64 |
| List all organizations .....                      | 65 |
| Get organization by organizationId .....          | 65 |
| Update an organization by organizationId .....    | 66 |
| ping .....  | 67 |
| Create a new platform .....                       | 67 |
| List all platforms .....                          | 68 |
| GET /platforms/protocols/{vendorProtocolId} ..... | 68 |
| Get a platform by platformId .....                | 69 |
| Update a platform by platformId .....             | 70 |
| Create a new project .....                        | 70 |
| List all projects .....                           | 71 |
| Get a project by projectId .....                  | 72 |
| Update a project by projectId .....               | 72 |
| Create a new protocol .....                       | 73 |
| List all protocols .....                          | 74 |
| Get a protocol by protocolId .....                | 74 |

|   |    |
|---|----|
| Update a protocol by protocolId .....           | 75 |
| Create new vendors for a given protocolId ..... | 75 |
| List all vendors for a given protocolId .....   | 76 |
| Update vendors for a given protocolId .....     | 77 |
| Create a new reference .....                    | 77 |
| List all references .....                       | 78 |
| GET /references/{referenceId} .....             | 79 |
| Update a reference by referenceId .....         | 79 |
| /restprofiles/ .....                            | 80 |
| Definitions .....                               | 81 |
| AnalysisDTO .....                               | 81 |
| ConfigSettingsDTO .....                         | 82 |
| ContactDTO .....                                | 82 |
| CvDTO .....                                     | 83 |
| CvGroupDTO .....                                | 84 |
| DataSetDTO .....                                | 84 |
| DisplayDTO .....                                | 86 |

# Overview

The GDM web service API provides a comprehensive set of RESTful methods for accomplishing the following core tasks in the GOBii Genomic Data Management (GDM) system. This manual explains the GDM web architecture and its web service operations.

## Overview

GOBii's internal documentation explains in detail how the web service infrastructure is architected. It is not necessary for a consumer of the GOBii web API to understand this in great detail. However, knowing a few things about it will make it easier to understand the web method documentation.

## Language and Framework

GOBii Web Services are implemented in Java with the Spring framework. Virtually all calls conform to the same basic structure. For example, the /analyses POST method is as follows:

```
@RequestMapping(value = "/analyses", method = RequestMethod.POST)
@ResponseBody
public PayloadEnvelope<AnalysisDTO> createAnalysis(@ApiParam(required = true)
@RequestBody PayloadEnvelope<AnalysisDTO> analysisPostEnvelope,
                                                    HttpServletRequest request,
                                                    HttpServletResponse response) {

    PayloadEnvelope<AnalysisDTO> returnVal = new PayloadEnvelope<>();

    // populate returnVal . . .

    return returnVal;
}
```

The request and response are almost always wrapped in a type-parameterized PayloadEnvelope. In this case, the PayloadEnvelope is type-parameterized for the AnalysisDTO. Other methods are type parameterized according to the entity that they touch (e.g., the implementation of the /datasets POST method is type-parameterized for the DataSetDTO).

## The DTO Payload

The DTO objects are lightweight classes that contain simple data properties. They correspond

roughly but not exactly to entities in the database (for example, in some cases a DTO defines a child collection of foreign-keyed entities).

For a client of this application, however, the strongly-typed nature of the implementation is irrelevant: all request responses and bodies are conveyed in plain JSON, and it is the application's job to serialize and deserialize accordingly. What a client implementation must take into account, however, is the structure of the DTO that pertains to a specific call. From the reference section for each web method in this document, you can navigate to the DTO definition.

## Request/Response Structure

The following illustrates the http body structure encompassed by the `PayloadEnvelope`. As mentioned above, it is the same for almost all responses as well as for the body of POST and PUT requests.

```

{
  "payload":{
    "linkCollection":{
      "linksPerDataItem":[

      ],
      "exploreLinksPerDataItem":[

      ]
    },
    "data":[

    ]
  },
  "header":{
    "gobiiProcessType":"",
    "dtoHeaderAuth":{
      "userName":null,
      "password":null,
      "token":"",
      "gobiiCropType":""
    },
    "status":{
      "succeeded":true,
      "statusMessages":[

      ],
      "statusMessagesByCode":{

      }
    },
    "pagination":null,
    "gobiiVersion":"2.0_2018-07-31",
    "cropType":""
  }
}

```

For requests, the following keys can be omitted:

- payload.linkCollection
- header

The content of the "data" array will vary depending on how the call is type-parameterized. For example, for a POST to the the /project resource, it will contain a project object, as defined by ProjectDTO.

# Authentication

All calls except for /configsettings GET require a valid authentication token. The token can be acquired via a POST to the /auth resource with an empty body and the following request headers set:

- X-Username
- X-Password

The specified header values must, of course, be a valid GOBii username and password. Both values are expected to be unencrypted (https will provide encryption for the overall request stream).

GOBii users must be defined in the system's LDAP and in the GOBii contact table. Accordingly, there can be two types of authentication failures:

- 401 Unauthorized: the user does not authenticate to LDAP;
- 403 Forbidden: the contact record does not exist. In this case, the error will indicate "Missing contact info for user <user-name> in crop database <crop-db>; a contact record must have username = <user-name>";

When authentication succeeds, the response headers will contain an X-Auth-Token key whose value is a valid token. For subsequent requests, it is sufficient to supply X-Auth-Token in the request headers with the token that was received from the /auth POST. Some browsers prevent the client code from reading custom response headers. For such cases, the token value can also be retrieved from the "token" key in the "dtoHeaderAuth" object.

## Error Handling

Errors internal to GOBii are reported in the "header" key accompanying the response. An example of how to retrieve error data is provided in the following code fragment.

```
if (!header.getStatus().isSucceeded() ||
    header
        .getStatus()
        .getStatusMessages()
        .stream()
        .filter(headerStatusMessage ->
headerStatusMessage.getGobiiStatusLevel().equals(GobiiStatusLevel.VALIDATION))
        .count() > 0) {
    returnVal = true;
    System.out.println();
    System.out.println("*** Header errors: ");
    for (HeaderStatusMessage currentStatusMessage :
header.getStatus().getStatusMessages()) {
        System.out.println(currentStatusMessage.getMessage());
    }
}
```

# Paths

## Get Allele Matrices

```
GET /brapi/v1/allelematrices
```

### Description

Get allele matrices by given study db id

### Parameters

| Type  | Name                  | Description | Schema |
|-------|-----------------------|-------------|--------|
| Query | <b>studyDbId</b><br>— | Study DB Id | string |

### Responses

| HTTP Code | Description          | Schema |
|-----------|----------------------|--------|
| 200       | successful operation | string |

### Produces

- `application/json`

### Tags

- BrAPI

## Search Allele Matrix

```
POST /brapi/v1/allelematrix-search
```

### Description

Search allele matrix using marker profiles

### Parameters

| Type  | Name                              | Description       | Schema |
|-------|-----------------------------------|-------------------|--------|
| Query | <b>markerprofile</b><br>DbId<br>— | Marker Profile Id | string |
| Query | <b>matrixDbId</b><br>—            | Matrix DB Id      | string |

## Responses

| HTTP Code | Description          | Schema |
|-----------|----------------------|--------|
| 200       | successful operation | string |

## Produces

- `application/json`

## Tags

- BrAPI

# Search Allele Matrix

```
GET /brapi/v1/allelematrix-search
```

## Description

Search allele matrix using marker profiles

## Parameters

| Type  | Name                              | Description       | Schema |
|-------|-----------------------------------|-------------------|--------|
| Query | <b>markerprofile</b><br>DbId<br>— | Marker Profile Id | string |
| Query | <b>matrixDbId</b><br>—            | Matrix DB Id      | string |

## Responses

| HTTP Code | Description          | Schema |
|-----------|----------------------|--------|
| 200       | successful operation | string |

## Produces

- `application/json`

## Tags

- BrAPI

# Get Allele Matrix Job status

```
GET /brapi/v1/allelematrix-search/status/{jobId}
```

## Description

Get allele matrix Job status

## Parameters

| Type | Name       | Description | Schema |
|------|------------|-------------|--------|
| Path | jobId<br>— | Job Id      | string |

## Responses

| HTTP Code | Description          | Schema |
|-----------|----------------------|--------|
| 200       | successful operation | string |

## Produces

- `application/json`

## Tags

# List all calls.

```
GET /brapi/v1/calls
```

## Description

List all calls

## Responses

| HTTP Code | Description          | Schema |
|-----------|----------------------|--------|
| 200       | successful operation | string |

## Produces

- `application/json`

## Tags

- BrAPI

# List all files

GET /brapi/v1/files

## Description

List all the files in a given path.

## Parameters

| Type  | Name                  | Description               | Schema |
|-------|-----------------------|---------------------------|--------|
| Query | <code>fqp</code><br>— | Fully qualified path name | string |

## Responses

| HTTP Code | Description          | Schema     |
|-----------|----------------------|------------|
| default   | successful operation | No Content |

## Produces

- `application/octet-stream`

# authenticate

POST /gobii/v1/auth

## Description

The user credentials are specified in the request headers X-Username and X-Password; the response and the response headers include the token in the X-Auth-Token header. X-Auth-Token header and value obtained from /auth call will be used as an API-key for the rest of the GDM calls.

## Parameters

| Type   | Name            | Description     | Schema |
|--------|-----------------|-----------------|--------|
| Header | X-Password<br>— | User password   | string |
| Header | X-Username<br>— | User Identifier | string |
| Body   | body<br>—       |                 | string |

## Responses

| HTTP Code | Description   | Schema |
|-----------|---|--------|
| 200       | OK<br>Headers :<br>`X-Auth-Token` (string) : API key to authenticate GDM api calls. | string |

## Tags

## Create a new NameID

```
POST /gobii/v1/names/{entity}
```

### Description

Retrieves a list of name/ID combination for a given entity and name list. For the list of entities supported see class GobiiEntityNameType. This service is specifically implemented for these filter types: NAMES\_BY\_NAME\_LIST - given a list of names, return the same list with the corresponding ID in the database. If name doesn't exist, ID will be 0. NAMES\_BY\_NAME\_LIST\_RETURN\_EXISTS - given a list of names, return the list of names with ID that exists in the

database.NAMES\_BY\_NAME\_LIST\_RETURN\_ABSENT - given a list of names, return the list of names that doesn't exist in the database with 0 as the IDFilter value varies per entity. This can be cv group name, project ID, platform ID, etc.Example use case: entity = CV; filterType = NAMES\_BY\_NAME\_LIST; filterValue = germplasm\_typeResult will be a list of CV terms with ID having germplasm\_type as the cv group

## Parameters

| Type   | Name              | Description                       | Schema                                   |
|--------|-------------------|-----------------------------------|--|
| Header | X-Auth-Token<br>— | Authentication Token              | string                                   |
| Path   | entity<br>—       | The entity to be retrieved        | string                                   |
| Query  | filterType<br>—   | The filter type for the name list | string                                   |
| Query  | filterValue<br>—  | The value for the filter type     | string                                   |
| Body   | body<br>—         |                                   | <a href="#">PayloadEnvelopeNameIdDTO</a> |

## Responses

| HTTP Code | Description          | Schema                                   |
|-----------|----------------------|--|
| 200       | successful operation | <a href="#">PayloadEnvelopeNameIdDTO</a> |

## Tags

- Names

## List all NameIds

```
GET /gobii/v1/names/{entity}
```

## Description

List of name/ID combination for a given entity. For the list of entities supported see class GobiiEntityType.List can further be filtered out by specifying the filter type and value.For the list of filter types supported see class GobiiFilterType.Example use case: entity = CV; filterType = NAMES\_BY\_TYPE\_NAME; filterValue = statusResult will be a list of CV terms having status as the cv group

## Parameters

| Type   | Name              | Description                       | Schema |
|--------|-------------------|-----------------------------------|--------|
| Header | X-Auth-Token<br>— | Authentication Token              | string |
| Path   | entity<br>—       | The entity to be retrieved        | string |
| Query  | filterType<br>—   | The filter type for the name list | string |
| Query  | filterValue<br>—  | The value for the filter type     | string |

## Responses

| HTTP Code | Description          | Schema                                   |

## /restprofiles/

PUT /gobii/v1/restprofiles

## Description

Update REST profiles When the Header of the payload envelope for a resource contains maxGet, maxPost, and maxPut values, this resource provides a means to update the max for a given rest resource ID and for a given HTTP verb. The values are transient in the sense that they will be confined only to a specific web service deployment. They are stored in the web service configurationdocument

## Parameters

| Type   | Name                     | Description          | Schema  |
|--------|--------------------------|----------------------|---|
| Header | <b>X-Auth-Token</b><br>— | Authentication Token | string  |
| Body   | <b>body</b><br>—         |                      | <a href="#">PayloadEnvelopeRestProfileDTO</a> |

## Responses

| HTTP Code | Description          | Schema  |
|-----------|----------------------|---|
| 200       | successful operation | <a href="#">PayloadEnvelopeRestProfileDTO</a> |
